What is Cancer ?

Cancer is an abnormal cellular proliferation, a new growth within an animal body. It is abnormal because it is not found normally in one and all animals. Cancer growth is characterised by certain definite peculiarities of metabolism, structure and associations. The Cancer cell has characteristics which distinguish it from all the other types of cell in the body. This new growth is termed as "NEOPLASM". *Neoplastic Granuloma* conveys the same meaning. It means progressive parasitic and often disruptive proliferation. They go on growing at the expense of the normal cells of the organism at a rapid or slow rate. This new growth of an abnormal collection of its cells uncoordinated with that of the normal cells and tissues.

The term neoplasm is often equated with tumour, though the term tumour has been used in medicine since long to include many pathological conditions in which local swelling or enlargement is the characteristic feature.

A neoplasm or tumour is hard and does not yield to pressure, whereas a cyst is filled with fluid and yields to pressure.

A tumour does not pit on pressure and is generally localised whereas an oedema pits on pressure and may cover a large area of the body.

An inflammation has redness, heat, pain and loss of function. Such indications are not found in tumour. Hyperplasia is the

Treatment of Cancer

Those who have successfully treated this disease have treated it not as a local disease but as a constitutional manifestation.

If it were possible to keep the vitality of the person at or near the normal healthy standard, there would be no danger of Cancer.

Many times it so happens that patients do not respond to the action of indicated remedies. It is due to the unbalanced chemistry of tissue fluids. No form of local treatment will ever cure cancer, because it is in the blood and must be reached through the blood.

Do not starve your patients. See that they get good nourishment. The general health must improve before the Cancer will begin to improve.

See that the bowels of the patients move every day to ensure proper detoxication and excretions of poisons from the body.

Do not permit your patients to be excited over startling news in the press—that, the orthodox group (Allopaths) has discovered a cure for Cancer. They have been bluffing society *since more than a century and a half. They cannot develop a cure for Cancer or anyother chronic disease, their approach is wrong.*

See that the patients get fresh air and exercise as far as possible.

Never allow yourself to be influenced by anyother physician's diagnosis. Do not form any opinion until you have *personally examined* the case.

5

Therapeutic Hints

1. **Acetic Acid** : Hard cancer of stomach in the distal aperture opening into the duodenum with predominance of connective tissue. Gnawing burning pain in stomach > lying on stomach.

Agony and depression prevents sleep ; copious pale urine.

Constant thirst.

Pale waxen skin.

(Red spot on left cheek with no thirst if accompanied with fever). Tongue is pale and flabby.

Vomiting after every meal of yellow yeast like matter or blood.

Dropsy of lower extremities (may be).

Especially useful after surgical shock after anaesthesia when prostration is marked.

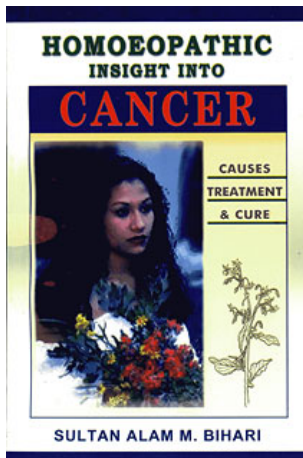

(It should not be repeated often not before 20-30 days.)

A wet cloth moistened with *Acetic Acid* lx when applied over the stomach softens and dissolves the hard tumour of the stomach.

2. **Allium Cepa** : Ulcers on heel from friction of shoe ; pain in the stump of bones after surgical amputation.

Gangraina senilis.

3. **Ammonium Carb**: Pungent flat ulcers with white discharge, pain > pressure and > keeping limbs elevated.
